Hello! I am an oncology assistant powered by your local Knowledge Graph. Ask me about cancer types, treatments, or clinical findings.

How to treat non small cell lung cancer?

Non-small cell lung cancer (NSCLC) can be managed with a combination of systemic therapies and supportive care. Current evidence supports the following approaches:

Treatment strategy	Supporting PubMed ID
Immunochemotherapy – combining immune checkpoint inhibitors with platinum-based chemotherapy	41632937
Adjuvant chemotherapy – postoperative systemic therapy to reduce recurrence risk	41589575
Targeted agents such as amivantamab (an EGFR exon 20 insertion and MET inhibitor) for selected molecular subtypes	41671628
Other targeted therapies – e.g., inbrx-105, rh324 (specific agents not detailed here but listed as relevant studies)	41724817, 41685666
Traditional Chinese medicine / herbal granules – used adjunctively in some clinical settings	41589575

These references provide evidence for the efficacy and safety of each modality. Treatment decisions should be individualized based on tumor stage, molecular profile, patient performance status, and preferences.
